Pediatric Neurology Part I - Harvey B. Sarnat 2013-04-24

Modern neuroembryology integrates descriptive morphogenesis with more recent insight into molecular genetic programming and data enabled by cell-specific tissue markers that further define histogenesis. Maturation of individual neurons involves the development of energy pumps to maintain membrane excitability, ion channels, and membrane receptors. Most malformations of the nervous system are best understood in the context of aberrations of normal developmental processes that result in abnormal structure and function. Early malformations usually are disorders of genetic expression along gradients of the three axes of the neural tube, defective segmentation, or mixed lineages of individual cells. Later disorders mainly involve cellular migrations, axonal pathfinding, synaptogenesis, and myelination. Advances in neuroimaging now enable the diagnosis of many malformations in utero, at birth, or in early infancy in the living patient by abnormal macroscopic form of the brain. These images are complimented by modern neuropathological methods that disclose microscopic, immunocytochemical, and

subcellular details beyond the resolution of MRI. Correlations may be made of both normal and abnormal ontogenesis with clinical neurological and EEG maturation in the preterm or term neonate for a better understanding of perinatal neurological disease. Precision in terminology is a key to scientific communication.

Ringling ears: the neuroscience of tinnitus - Jos J. Eggermont

Tinnitus (ringing in the ears) is a prevalent and often debilitating disorder with approximately 10% of people (incorporating ages from children to the elderly) perceiving it continuously, and in 1-3% of the population it seriously affects the quality of life. The most common cause of tinnitus is hearing loss, and its prevalence has surged as a result from the various large-scale military actions in the Middle East in the last decade. Recent advances have been made in the area of behavioral animal models, in the understanding of human brain imaging aspects of tinnitus, and in addressing the long-range changes in human brain connectivity.

Furthermore continued exploration of the three major animal models of tinnitus: salicylate-induced, noise trauma induced, and resulting from somatic interactions with the auditory system has further delineated the relative roles of cochlear activity vs. central auditory system changes. Evidence for the role of neural synchrony changes in tinnitus originates both from human EEG and MEG studies as well as from neuron pair-correlation studies in animals.

European Handbook of Neurological Management - Nils Erik Gilhus 2011-07-12

Evidence-based, peer reviewed, best practice management guidelines for neurologists Diagnosis is only part of the puzzle. Effective treatment is what your patients really want. The European Federation of Neurological Societies has been publishing management guidelines in the European Journal of Neurology for many years. Developed by a consensus approach, using graded evidence, and then fully peer reviewed, these guidelines provide gold-standard, best-practice guidance to the treatment of neurological disorders. They help bridge the gap between what is done and what should be done for patients with neurological disorders. The basic guidelines have been expanded with 'Recommendations' based on strong evidence and 'Good Practice Points'

where only weaker evidence is available. The Guidelines in this volume cover: Investigation Major neurological diseases Neuromuscular diseases Infections Neurological problems Sleep disorders Rehabilitation The European Handbook of Neurological Management provides a thoroughly rounded and grounded approach to best-practice neurological management using evidence-based principles.

Neurology and Literature, 1860-1920 - A. Stiles 2007-09-28

Current Techniques in Operative Neurosurgery - Henry H. Schmidek 1977

Pediatric Neurology Part III - Norma Beatriz Romero 2013-04-24

Congenital myopathies are a heterogeneous group of inherited muscle disorders, characterized by the predominance of particular histopathological features on muscle biopsy, such as cores (central core disease) or rods (nemaline myopathy). Clinically, early onset of the disease, stable or slowly progressive muscle

weakness, hypotonia and delayed motor development are common in most forms. As a result, the diagnosis of a subtype of congenital myopathy is largely based on the presence of specific structural abnormalities in the skeletal muscle detected by enzyme-histochemistry and electron microscopy studies. During the last decades there have been significant advances in the identification of the genetic basis of most congenital myopathies. However, there is significant genetic heterogeneity within the main groups of congenital myopathies, and mutations in one particular gene may also cause diverse clinical and morphological phenotypes. Thus, the nosography and nosology in this field is still evolving.

War Neurology - L. Tatu 2016-04-04

Interest in the history of neurological science has increased significantly during the last decade, but the significance of war has been overlooked in related research. In contrast, this book highlights war as a factor of progress in neurological science. Light is shed on this little-known topic through accounts given by neurologists in war, experiences of soldiers suffering from neurological diseases, and chapters dedicated to neurology in total and contemporary war. Written by experts, the contributions in this book focus on the Napoleonic Wars, the American Civil War, the Franco-Prussian War of 1870, World Wars I and II, and recent conflicts such as Vietnam or Afghanistan. Comprehensive yet concise and accessible, this book serves as a fascinating read for neurologists, neurosurgeons, psychiatrists, historians, and anyone else interested in the history of neurology.

Controversies in Neuro-Ophthalmic

Management - Amanda D. Henderson

2021-06-25

This book functions as a resource for providers who treat patients with neuro-ophthalmic conditions. Using an evidence-based approach to controversial management decisions, the material is presented in a digestible, case-based format. Divided into six sections, the book begins with an introduction to its framework, format, and purpose. Following this, sections two, three, and four discuss various optic neuropathies, ocular motility disorders, and transient visual symptoms. The concluding sections then address neuro-ophthalmic manifestations of pain, including migraine and post-concussive syndrome, and systemic diseases, such as giant cell arteritis. Each chapter focuses on cases that are historically complex, or which have undergone a recent shift in traditional management due to new scientific discoveries or newly available therapies.

Controversies in Neuro-Ophthalmic Management presents essential, thorough information on management options and the data for their use to provide the best care for patients.

Neuroprotection - Raymond Chuen-Chung Chang 2019-08-28

Neuroprotection is a strategy to prevent or delay the progression of chronic neurodegenerative diseases, acute neurological disorders, or even mental disorders. The major aim of this book is to focus on different approaches to achieve neuroprotection. In this book, there are chapters discussing imidazoline ligands and opioid ligands in Alzheimer's disease, the beneficial effects of adenosine A2A receptor antagonist, adrenergic receptor agonists and antagonists modulating microglial responses, and different approaches to achieve neuroprotection against aging-associated macular degeneration. Pediatric Neurology - 2013-04-24

The child is neither an adult miniature nor an immature human being: at each age, it expresses specific abilities that optimize adaptation to its environment and development of new

acquisitions. Diseases in children cover all specialties encountered in adulthood, and neurology involves a particularly large area, ranging from the brain to the striated muscle, the generation and functioning of which require half the genes of the whole genome and a majority of mitochondrial ones. Human being nervous system is sensitive to prenatal aggression, is particularly immature at birth and development may be affected by a whole range of age-dependent disorders distinct from those that occur in adults. Even diseases more often encountered in adulthood than childhood may have specific expression in the developing nervous system. The course of chronic neurological diseases beginning before adolescence remains distinct from that of adult pathology - not only from the cognitive but also motor perspective, right into adulthood, and a whole area is developing for adult neurologists to care for these children with persisting neurological diseases when they become adults. Just as pediatric neurology evolved as an identified specialty as the volume and complexity of data became too much for the general pediatrician or the adult neurologist to master, the discipline has now continued to evolve into so many subspecialties, such as epilepsy, neuromuscular disease, stroke, malformations, neonatal neurology, metabolic diseases, etc., that the general pediatric neurologist no longer can reasonably possess in-depth expertise in all areas, particularly in dealing with complex cases. Subspecialty expertise thus is provided to some trainees through fellowship programmes following a general pediatric neurology residency and many of these fellowships include training in research. Since the infectious context, the genetic background and medical practice vary throughout the world, this diversity needs to be represented in a pediatric neurology textbook. Taken together, and although brain malformations (H. Sarnat & P. Curatolo, 2007) and oncology (W. Grisold & R. Soffietti) are covered in detail in other volumes of the same series and therefore only briefly addressed here, these considerations justify the number of volumes, and the number of authors who contributed from all over the world. Experts in the different subspecialties also contributed to design the general framework and contents of

the book. Special emphasis is given to the developmental aspect, and normal development is reminded whenever needed - brain, muscle and the immune system. The course of chronic diseases into adulthood and ethical issues specific to the developing nervous system are also addressed. A volume in the Handbook of Clinical Neurology series, which has an unparalleled reputation as the world's most comprehensive source of information in neurology International list of contributors including the leading workers in the field Describes the advances which have occurred in clinical neurology and the neurosciences, their impact on the understanding of neurological disorders and on patient care

This volume concentrates on adenosine receptor science, providing insights useful for actual drug discovery/development in neurology and psychiatry areas. Expertise of contributors

Subject including practical drug development from basic science, as translational research taste Structure of contents focusing on two CNS areas for diseases (neurology and psychiatry) *Cellular and Molecular Methods in Neuroscience Research* - Adalberto Merighi 2002-10-01

There are numerous books on cellular and molecular protocols for general use in cell biology but very few are exclusively devoted to neurobiology. This book fills this gap and explains in a clear and consistent manner, some of the more commonly used protocols in neuroscience research. Each chapter is written by either the person who invented the procedure or an expert in the field. The format is uniform: "Overview," "Background," "Protocols," and

"results and discussion." Each protocol begins with the principle of the technique, studies in cell culture, materials and reagents, and, lastly, step-by-step outline of the procedure itself. This highly practical book is also well illustrated (with 17 four color plates) to make the concepts and procedures easy to understand and perform.

Current Neurology - S. H. Appel 1997

The goal of the CURRENT NEUROLOGY series is to address the latest advances in the Neurosciences and their application to Neurologic disease. No field is changing more rapidly than Neurology, and all Neurologists have an increasing responsibility to use this information to help devise meaningful therapeutic strategies for the patients. To help achieve this goal, several areas for in-depth discussions are selected. The rapid advances in the muscular dystrophies is addressed with specific emphasis as to how these genetic breakthroughs will impact the therapy of these disorders in the future. Also discussed is therapeutic Neuro-ophthalmology which has always been of clinical importance for importance for Neurologists. Finally, the problem of pain is extremely important, and the latest understanding of neuropeptides and neuronal re-organization are discussed as the basis for future therapeutic approaches.

Inclusion-Body Myositis and Myopathies - Valerie Askanas 1998-04-13

This book is devoted entirely to discussing the two forms of inclusion-body myositis.
